SCRUM 2 & GitCommit

INFT3050

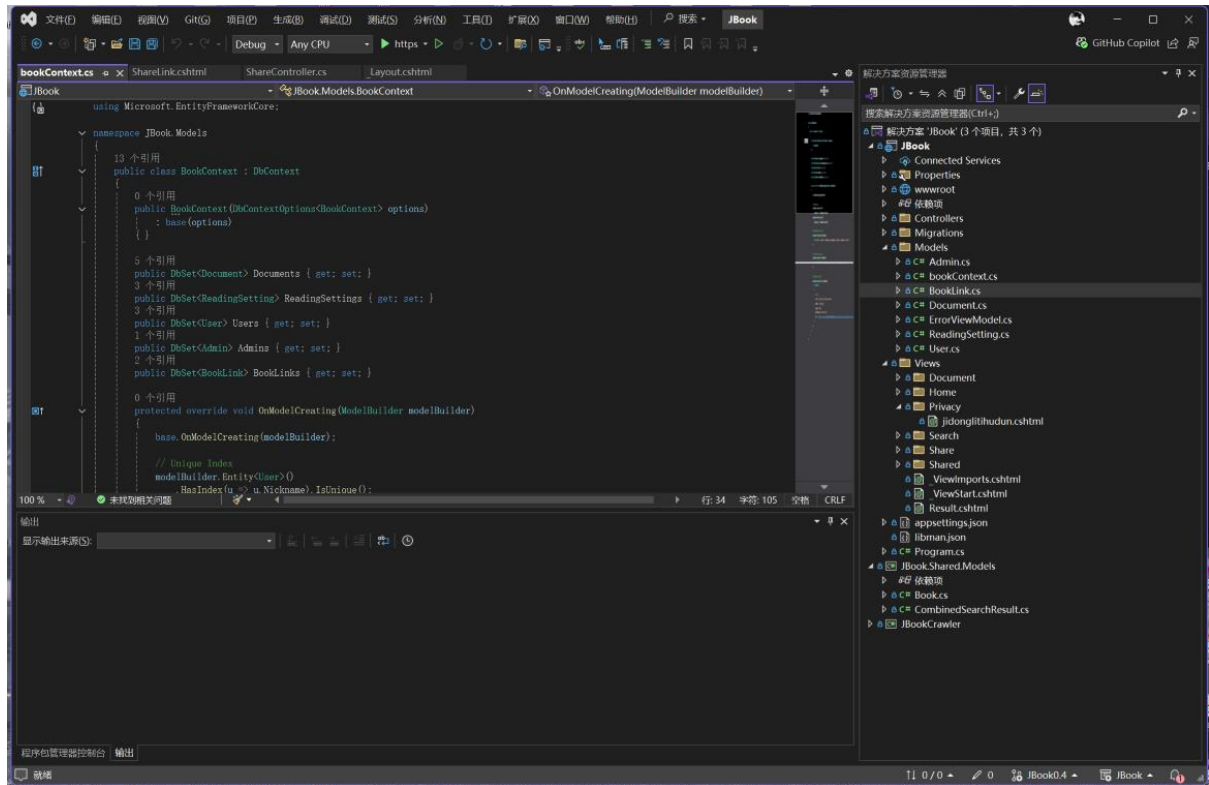

Web Programming

Group: JBMan

Tang Jiongzheng(c3509120)

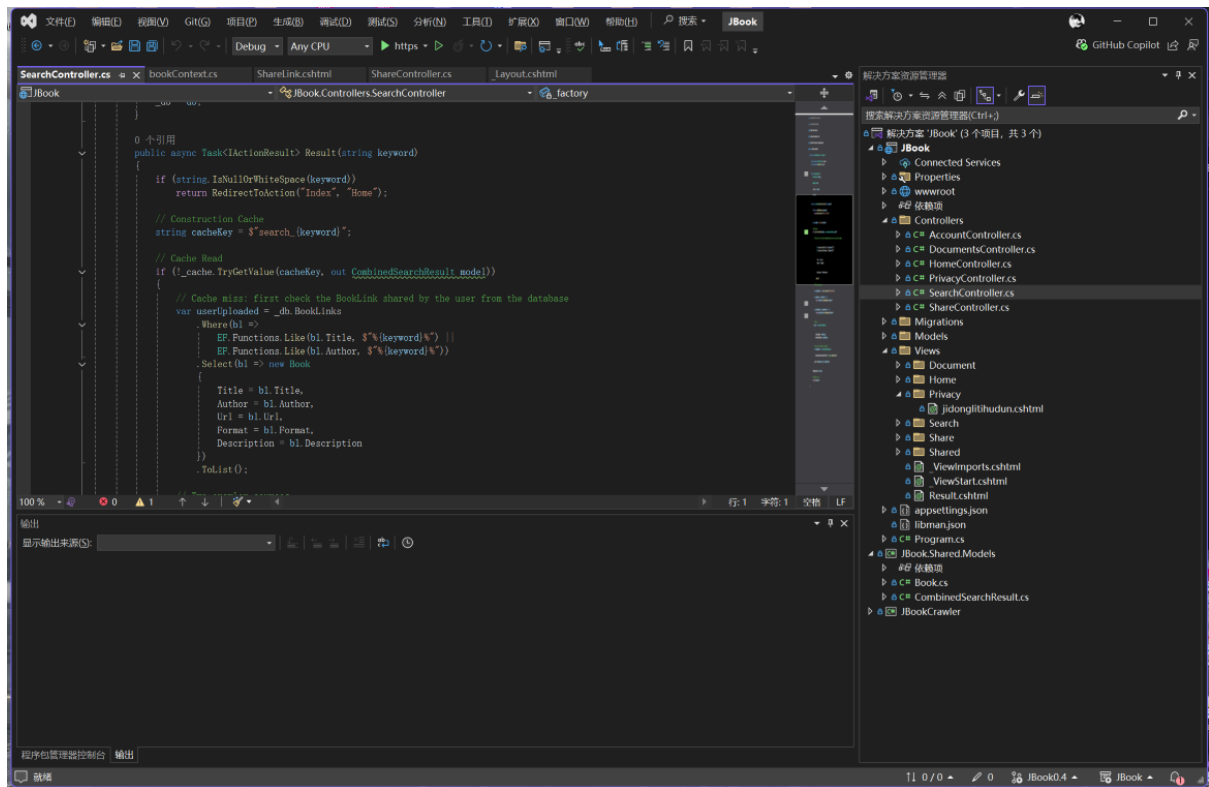

1. Unified database model and context

- Working closely with Chen Chengzhan, we merged and standardized all entity classes (User, Admin, BookLink, Document, ReadingSetting) and DbSet<> definitions in BookContext.
- We improved the initial data (seed data) to ensure that the administrator, sample users, and sample books can be created correctly after the database migration.

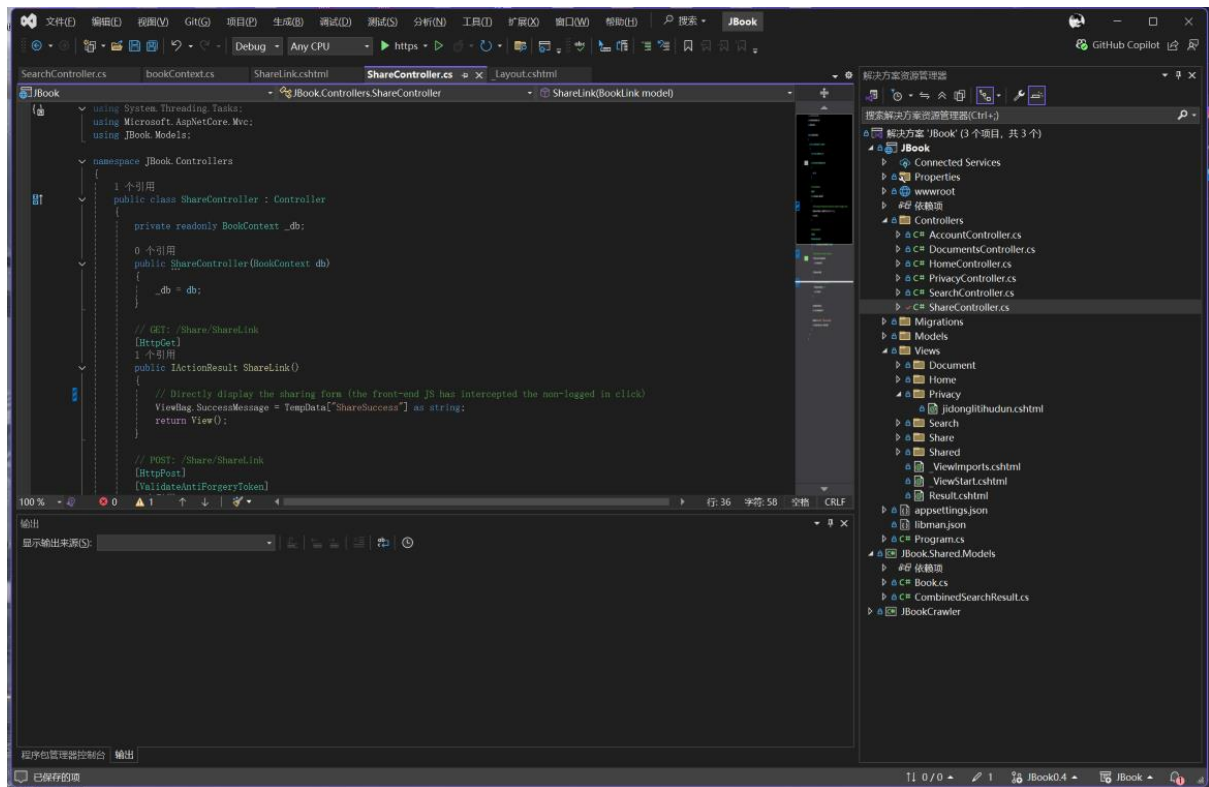

2. Search results integrate user sharing links

- Add a query to the BookLink table in SearchController, and use EF.Functions.Like to achieve fuzzy matching of titles or authors.
- Merge the results shared by users with the crawler results of ZLibrary and OpenLibrary, and pass them to the view through CombinedSearchResult. Users can see the links of community contributions and external book sources at the same time.

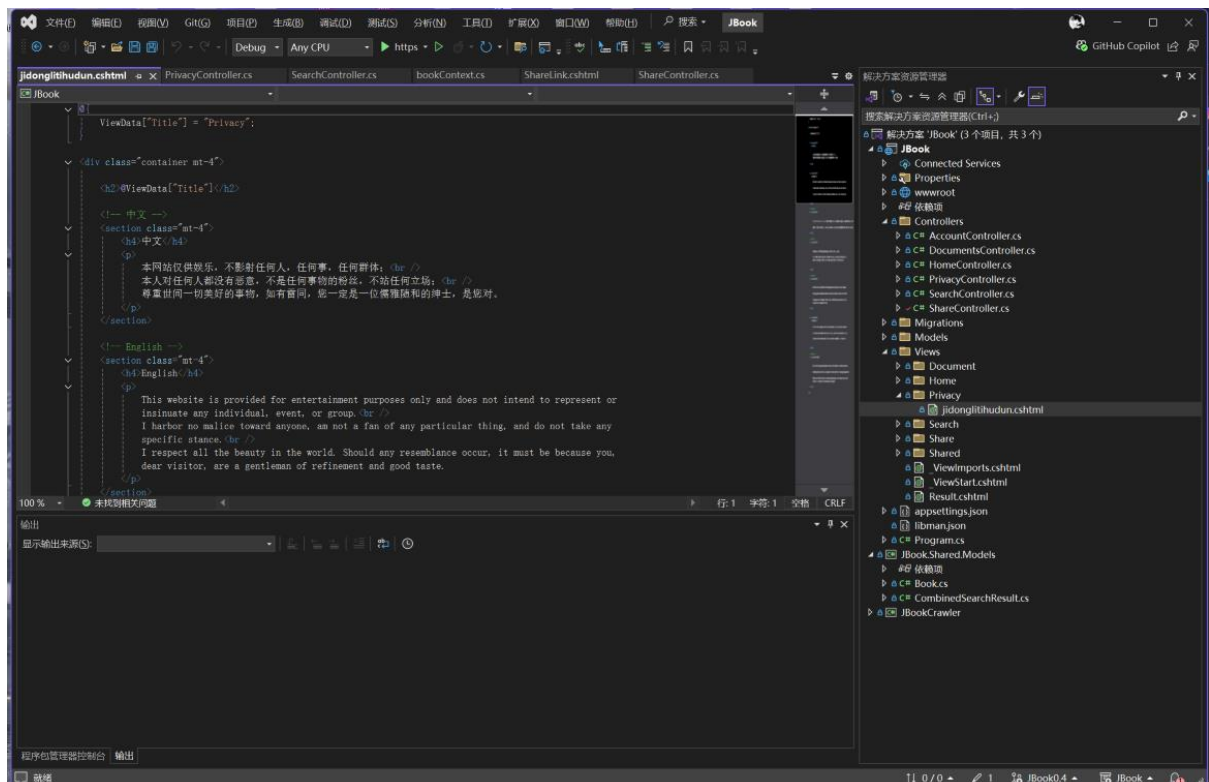

3. Complete the "Share" page

- Add ShareController and ShareLink views, which can only be accessed by logged-in users (User or Admin). When not logged in, a login window will pop up to force authentication.
- Users can fill in the book title, author, format, description and URL. After submission, the new record will be written to BookLink, and a pop-up window will prompt "Thank you for sharing".

4. Create a multilingual "Privacy" page

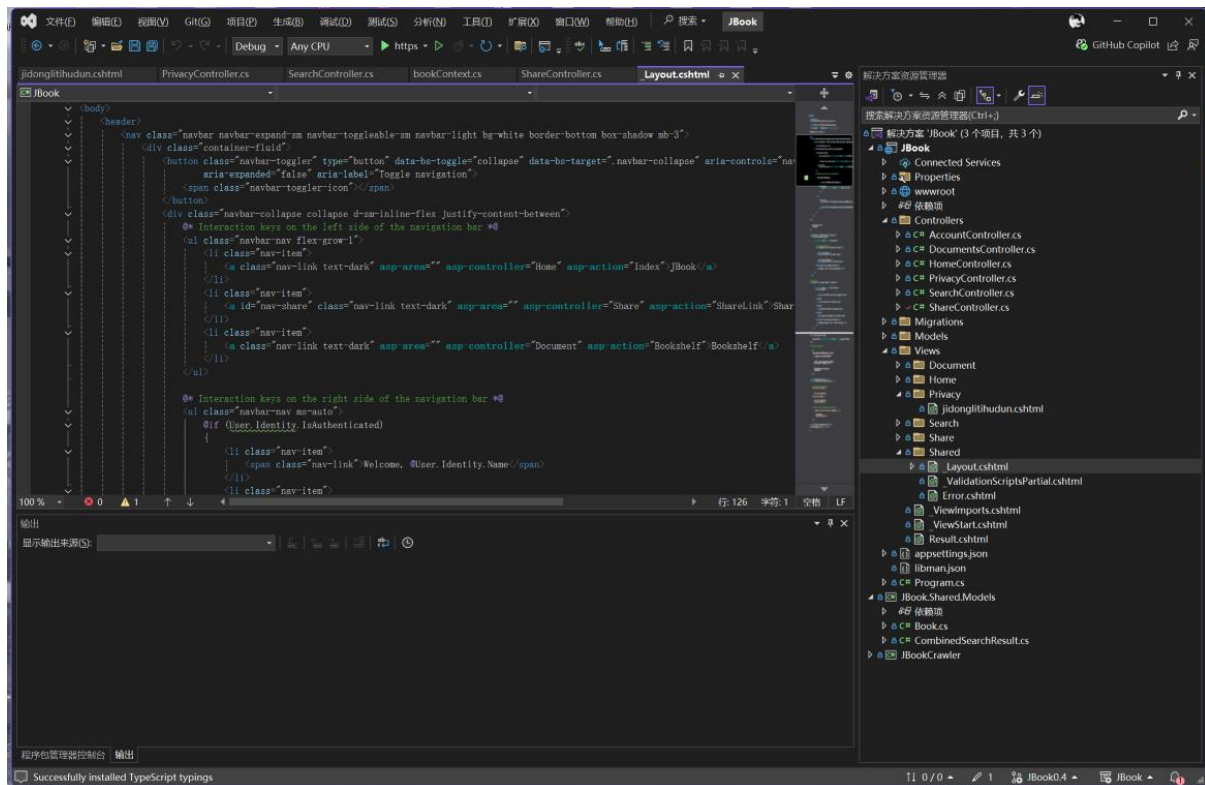

- Use PrivacyController + Views/Privacy/Index.cshtml to display Chinese, English, Japanese, Korean, German, French and Spanish versions of privacy statements side by side on the same page, removing the additional dependency on Controller.

5. Front-end templates and team collaboration

- Unified and optimized the shared layout file (_Layout.cshtml) and the basic styles of each main view, and added login/register/logout buttons and modal window logic in the navigation bar.

- Provided interfaces and sample markup for the visual front-end (Wang Bowen), on which he could complete the final UI design and detail adjustments.
